

One marketplace for every pantry spoke.

Food banks stay the hub. GoodCo gives approved pantries one shared place to see and move eligible surplus across the network.

The goal is not to replace the hub. It is to let the spokes help each other.

PROBLEM

Surplus and shortage can exist in the same network.

The hub may know the big picture, but individual pantries usually do not have a shared live view of each other's eligible inventory.

One pantry has too much

Short-dated produce, rescued food, or extra cases can sit locally.

Another pantry has need

Nearby demand may be invisible unless someone calls, texts, or asks the hub.

Time is the enemy

Perishable food loses value while people coordinate manually.

Problem addressed: match eligible surplus to shortage before food ages out.

The missing layer is governed lateral movement.

Existing workflows cover donations, hub ordering, and local records. They do not create one inventory-backed marketplace for the spokes.

Food-bank ordering

Good for hub-to-agency allocation. Not designed as a shared pantry-to-pantry market.

Local inventory sheets

Useful inside one pantry. Weak for network visibility, reservations, and transfer audit.

Food rescue dispatch

Strong for donor pickup. Different problem from moving already-inventoried pantry surplus.

What GoodCo adds

Inventory-backed listings

Quantity reservation before pickup

Policy guardrails for restricted food

Audit trail for handoff and receipt

Verified inventory becomes a shared market.

A pantry can only publish what it has already reviewed and confirmed. That keeps the marketplace useful instead of becoming a fake catalog.

1

Receive

Barcode, manual, photo, or voice.

2

Review

Human confirms quantity, category, and date.

3

Publish

Only eligible surplus enters the market.

4

Reserve

Claimed quantity is held for pickup.

5

Transfer

Handoff and receipt leave a record.

One marketplace

Every approved spoke sees the same eligible listings.

Inventory-backed

Publishing does not reduce stock. Reservation does.

Governed

No payments in MVP. Restricted food can be blocked by policy.

Built to be cheap enough to run.

The product uses free data and browser-native capture first. AI is a structured fallback, not an always-on vision pipeline.

Lookup first	Open Food Facts and USDA FoodData Central before LLM parsing.
No-barcode intake	Browser speech-to-text turns staff descriptions into a draft Review form.
Light AI use	LLM fills structured fields only after barcode/data rules are insufficient.
Open tools	Tesseract OCR, ZXing barcode scanning, Supabase/Postgres audit records.

Pilot impact metrics

Lots moved before expiry
Requests fulfilled from nearby pantries
Expired inventory avoided
Hub interventions avoided
